Building material "ThermoCem® light"

here: Water hygiene testing and evaluation while taking into account
the Technical Rules of LAGA [Working Group of the German Federal States on
Waste] No. 20

Your letter dated 24.05.2018; Dr Andreas Märten / Mr Rainer Knaup
and our test report A-180556-09-To dated 24.08.2009

Dear Sir or Madam,

We have tested, as ordered, the sample of a building material called "ThermoCem® light",
sent together with the aforementioned letter, with regard to its composition (substance
analysis) in accordance with Table II.1.2-2 of LAGA Notice M20.

Compared with the last testing of this building material in our house (A-180556-09-To), it
was to be tested whether the composition was subject to consistent quality and to what
extent the results from previous water hygiene tests continued to be transferable.

The results of our tests and assessments apply to the examined test objects and the statutory rules at the time of
testing. The accreditation applies to the test procedures listed in the attachment to the accreditation certificate
(<http://www.hyg.de>). Examinations which do not fall into the accredited area are marked.

Deutsche
Akkreditierungsstelle
D-PL-13042-02-00

Institute owner: Verein zur Bekämpfung der Volkskrankheiten im Ruhrkohlengebiet e.V., Gelsenkirchen, Association register: VR 519 District court Gelsenkirchen
VAT ID: DE125018356, Board of directors: Prof. Dr. Werner Schlake (chairman), Prof. Dr. Jürgen Kretschmann, Dr. Emanuel Grün, Dr. Dirk Waider, Prof. Dr. Lothar Dunemann

On the basis of the laboratory tests performed, in our view, it can be deduced that the solid characteristics continue to correspond to the product quality of the previous tests. In this sense, we can ascertain transferability also with regard to the resulting water soluble components.

Test results

1. Substance analysis

On the basis of the test results obtained, the nature of building material called "ThermoCem® light" was largely comparable to that of an anthropogenically unpolluted soil with regard to the ingredients tested by us. The contents of heavy metals and metalloids and the concentrations of the organic ingredients determined, could therefore be classified as unremarkable. By way of derogation from this, the pH value indicated a strong alkaline reaction of the material, as is typical of building materials of similar origin.

2. Eluate analyses

With regard to elutable ingredients and on the basis of the reference values available, it could be expected that these are equally present in largely unremarkable concentrations only.

So far, both briefly after solidification of the test specimen and after a curing period of 28 days (cf. Attachments 4 and 5), no appreciable content of heavy metals including chromium VI and arsenic compounds could be detected in the corresponding aqueous elution solutions. The measured values for electrical conductivity established (EL: 212 μScm^{-1} and 98 μScm^{-1}) were not higher than in case of leaching of anthropogenically unaffected soils.

In contrast, the waters are characterized by a significant alkalinity (elution during the curing phase: pH = 10.79, elution after the 28-day curing phase: pH = 10.15), which is mainly due on dissolved alkaline earth metal hydroxides (Calcium hydroxide). This fact is - as already expressed in Section 1 (Substance analysis) - typical for building materials of the origin given here.

Evaluation

By taking into consideration the test results obtained, it was established that building material "ThermoCem® light" can continue to be considered harmless from a water hygiene point of view. The pH value shift and increase of salinity of any existing ground or surface water expected in the course of construction measures is to be considered temporary only and locally limited only.

With reference to the abovementioned LAGA Guideline No. 20, Tables II 1.2-2 and II 1.2-3, the sample of "ThermoCem® light" tested by us can be classified under RCL ("recycled building materials") utilisation class Z 0.

Yours faithfully
On behalf of
Director of the Institute

Dipl.-Umweltwiss. Sebastian Bien
Deputy Head of Department of
Waste Water, Soil and Air Hygiene
